

Local Search

Evaluate and modify one or more *current states* rather than systematically exploring paths from an initial state.

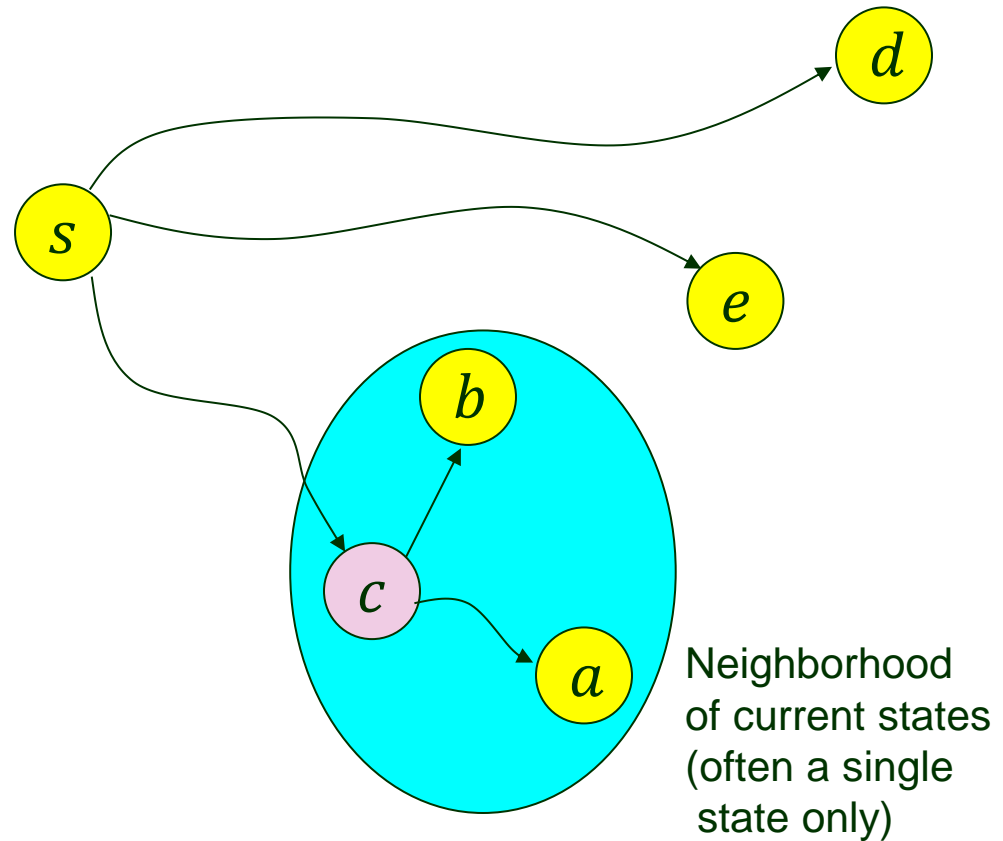

Local Search

Evaluate and modify one or more *current states* rather than systematically exploring paths from an initial state.

Outline

- I. Hill climbing
- II. Simulated annealing
- III. Genetic algorithms

Advantages of Local Search

- ◆ Use of very little memory.
- ◆ Finding good solutions in state spaces *intractable* for a systematic search.
- ◆ Useful in pure optimization (e.g., gradient-based ascent/descent methods)

Advantages of Local Search

- ◆ Use of very little memory.
- ◆ Finding good solutions in state spaces *intractable* for a systematic search.
- ◆ Useful in pure optimization (e.g., gradient-based ascent/descent methods)

State Space Landscape

I. Hill Climbing

function HILL-CLIMBING(*problem*) **returns** a state that is a local maximum
current \leftarrow *problem*.INITIAL
while *true* **do**
 neighbor \leftarrow a highest-valued successor state of *current*
 if VALUE(*neighbor*) \leq VALUE(*current*) **then return** *current*
 current \leftarrow *neighbor*

I. Hill Climbing

```
function HILL-CLIMBING(problem) returns a state that is a local maximum
  current  $\leftarrow$  problem.INITIAL
  while true do
    neighbor  $\leftarrow$  a highest-valued successor state of current // random choice
    // to break a tile
    if VALUE(neighbor)  $\leq$  VALUE(current) then return current
    current  $\leftarrow$  neighbor
```

I. Hill Climbing

function HILL-CLIMBING(*problem*) **returns** a state that is a local maximum

current \leftarrow *problem*.INITIAL

while *true* **do**

neighbor \leftarrow a highest-valued successor state of *current* // random choice
// to break a tile

if VALUE(*neighbor*) \leq VALUE(*current*) **then return** *current*

current \leftarrow *neighbor*

- ◆ Hill climbing can make rapid progress toward a solution.

Drawback of Hill Climbing (1)

Hill climbing terminates when a peak is reached with no neighbor having a higher value.

Drawback of Hill Climbing (1)

Hill climbing terminates when a peak is reached with no neighbor having a higher value.

- ♠ Local maximum

Not the global maximum.

Drawback of Hill Climbing (1)

Hill climbing terminates when a peak is reached with no neighbor having a higher value.

♠ Local maximum →

Not the global maximum.

Drawback of Hill Climbing (1)

Hill climbing terminates when a peak is reached with no neighbor having a higher value.

♠ Local maximum →

Not the global maximum.

Every move of one queen introduces more conflicts.

Drawback of Hill Climbing (1)

Hill climbing terminates when a peak is reached with no neighbor having a higher value.

♠ **Local maximum** →

Not the global maximum.

Hill climbing in the vicinity of a local maximum will be drawn toward it and then get stuck there.

Every move of one queen introduces more conflicts.

Drawback of Hill Climbing (2)

♠ **Ridge:** A sequence of local maxima difficult to navigate.

At each local maximum, all available actions are downhill.

Drawback of Hill Climbing (2)

- ♠ **Ridge:** A sequence of local maxima difficult to navigate.

At each local maximum, all available actions are downhill.

- ♠ **Plateaus:** No uphill actions exist.

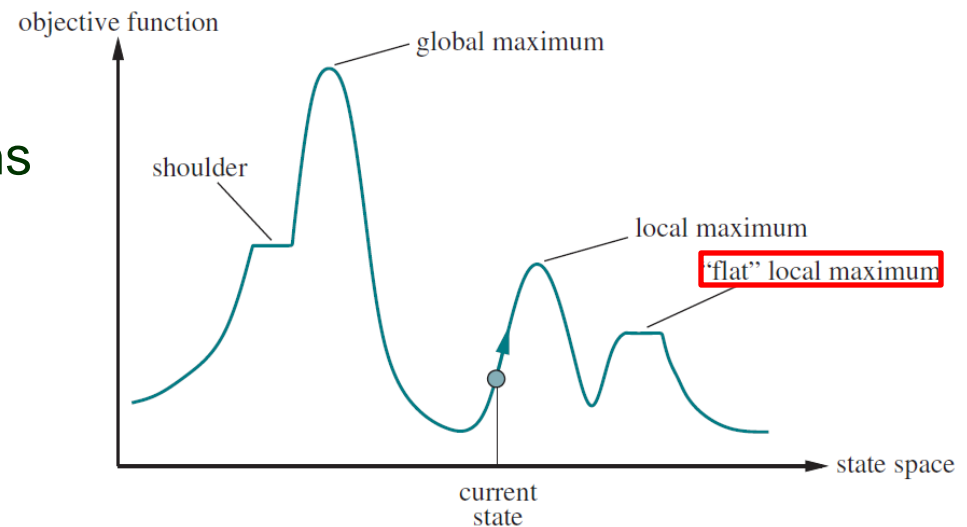

Drawback of Hill Climbing (2)

- ♠ **Ridge:** A sequence of local maxima difficult to navigate.

At each local maximum, all available actions are downhill.

- ♠ **Plateaus:** No uphill actions exist.

Variations of Hill Climbing

- ◆ Stochastic hill climbing
 - Random selection among the uphill moves.
 - Probability of selection varying with steepness..

Variations of Hill Climbing

- ◆ Stochastic hill climbing
 - Random selection among the uphill moves.
 - Probability of selection varying with steepness..
- ◆ First-choice hill climbing
 - Random generation of successors until a better (than the current) one is found.
 - Useful when many successors exist and/or the objective function is costly to evaluate.

Variations of Hill Climbing

- ◆ Stochastic hill climbing

 - Probability of selection varying with steepness..
- ◆ First-choice hill climbing
 - Random generation of successors until a better (than the current) one is found.
 - Useful when many successors exist and/or the objective function is costly to evaluate.
- ◆ Random restart hill climbing
 - Restart search from random initial state.

II. Simulated Annealing

Annealing: Heat a metal to a high temperature and then gradually cool it, allowing the material to reach a low-energy crystalline state so it is hardened.

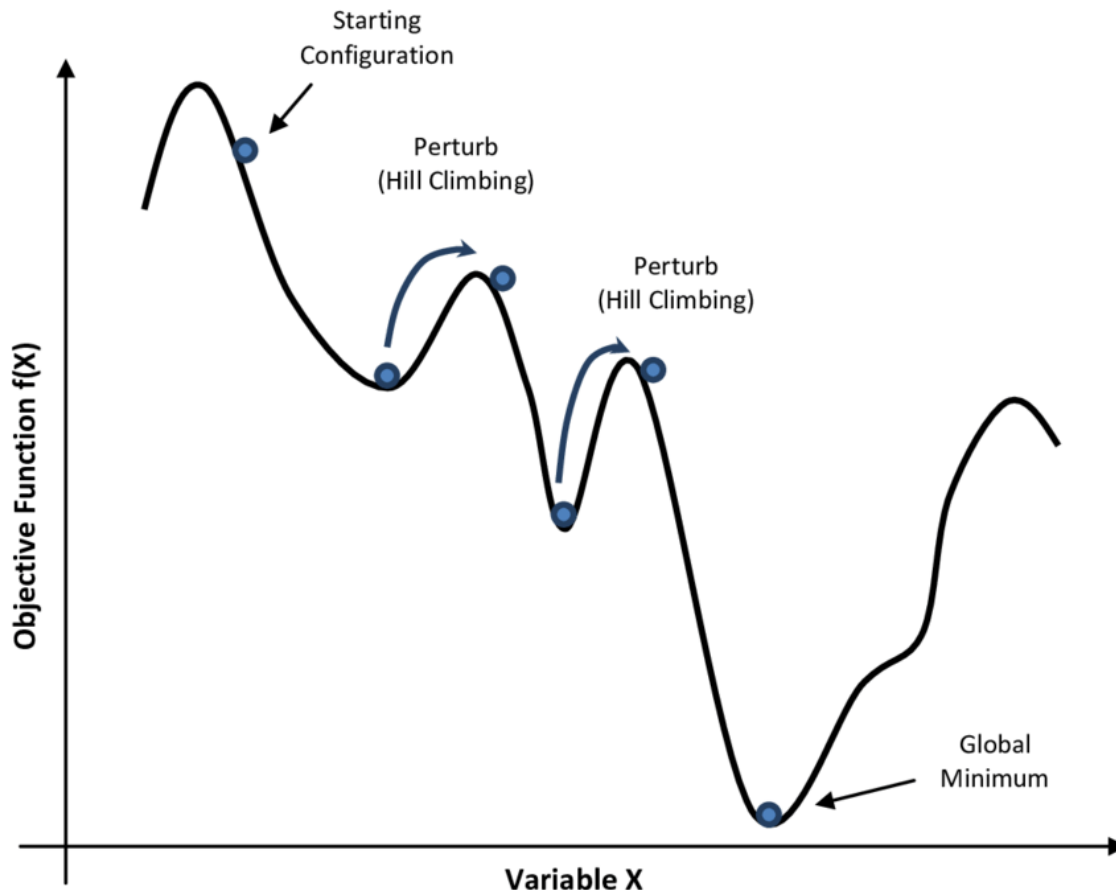

II. Simulated Annealing

Annealing: Heat a metal to a high temperature and then gradually cool it, allowing the material to reach a low-energy crystalline state so it is hardened.

II. Simulated Annealing

Annealing: Heat a metal to a high temperature and then gradually cool it, allowing the material to reach a low-energy crystalline state so it is hardened.

- Start by shaking hard (i.e., at high temperature).
- Gradually reduce the intensity of shaking (i.e., lower the temperature).

Simulated Annealing Algorithm

function SIMULATED-ANNEALING(*problem*, *schedule*) **returns** a solution state

current \leftarrow *problem*.INITIAL

for $t = 1$ **to** ∞ **do**

Temperature $\rightarrow T \leftarrow$ *schedule*(t)

if $T = 0$ **then return** *current* // solution

$\lim_{t \rightarrow \infty} T = 0$

next \leftarrow a randomly selected successor of *current*

Badness
is $-\Delta E$.

$\rightarrow \Delta E \leftarrow$ VALUE(*current*) - VALUE(*next*)

if $\Delta E > 0$ **then** *current* \leftarrow *next* // the next state is better; choose it. .

else *current* \leftarrow *next* only with probability $e^{-\Delta E/T}$

Minimization

- Accept the next state if it is an improvement ($\Delta E > 0$).
- Otherwise, accept it with a probability that decreases exponentially
 - ◆ as the badness $-\Delta E$ of the move increases ($\frac{\Delta E}{T} < 0$ decreases), and
 - ◆ as the “temperature” goes down ($\frac{\Delta E}{T} < 0$ decreases).

Bad moves are more tolerated at the start when *T* is high and become less likely as *T* decreases.

- Escape local minima by allowing bad moves.

More About SA

- ◆ $T \rightarrow 0$ slowly enough

More About SA

- ◆ $T \rightarrow 0$ slowly enough

A property of Boltzmann distribution $e^{\Delta E/T}$ guarantees the global minimum with probability $\rightarrow 1$.

More About SA

- ◆ $T \rightarrow 0$ slowly enough

A property of Boltzmann distribution $e^{\Delta E/T}$ guarantees the global minimum with probability $\rightarrow 1$.

- ◆ Commonly used $T \leftarrow cT$ with constant $c < 1$ and close to 1 at each step.

More About SA

- ◆ $T \rightarrow 0$ slowly enough

A property of Boltzmann distribution $e^{\Delta E/T}$ guarantees the global minimum with probability $\rightarrow 1$.

- ◆ Commonly used $T \leftarrow cT$ with constant $c < 1$ and close to 1 at each step.
- ◆ Applied to many problems:
 - VLSL layout
 - factory scheduling
 - aircraft trajectory planning
 - NP-hard optimization (i.e., the traveling salesman problem)
 - large-scale stochastic optimization tasks

Local Beam Search

Keep track of k states rather than one.

1. Start with k randomly generated states.
2. Generate all their successors.
3. Stop if any successor is a goal.
4. Otherwise, keep the k best successors and go back to step 2.

Local Beam Search

Keep track of k states rather than one.

1. Start with k randomly generated states.
2. Generate all their successors.
3. Stop if any successor is a goal.
4. Otherwise, keep the k best successors and go back to step 2.

♣ May suffer from a lack of diversity among the k states.

Local Beam Search

Keep track of k states rather than one.

1. Start with k randomly generated states.
2. Generate all their successors.
3. Stop if any successor is a goal.
4. Otherwise, keep the k best successors and go back to step 2.

♣ May suffer from a lack of diversity among the k states.

Solution: stochastic beam search which chooses successors with probabilities proportional to their values.

III. Evolutionary Algorithms

- ♣ Also called *genetic algorithms*.
- ♣ Inspired by natural selection in biology.

III. Evolutionary Algorithms

- ♣ Also called *genetic algorithms*.

- ♣ Inspired by natural selection in biology.

1. Start with a population of k randomly generated states (individuals).

III. Evolutionary Algorithms

- ♣ Also called *genetic algorithms*.

- ♣ Inspired by natural selection in biology.

1. Start with a population of k randomly generated states (individuals).
2. Select the *most fit* individuals to become parents of the next generation

III. Evolutionary Algorithms

- ♣ Also called *genetic algorithms*.

- ♣ Inspired by natural selection in biology.

1. Start with a population of k randomly generated states (individuals).
2. Select the *most fit* individuals to become parents of the next generation
3. Combine every ρ parents to form an offspring (typically $\rho = 2$).

III. Evolutionary Algorithms

- ♣ Also called *genetic algorithms*.

- ♣ Inspired by natural selection in biology.

1. Start with a population of k randomly generated states (individuals).
2. Select the *most fit* individuals to become parents of the next generation
3. Combine every ρ parents to form an offspring (typically $\rho = 2$).

Crossover: Split each of the parent strings and recombine the parts to form two children.

III. Evolutionary Algorithms

- ♣ Also called *genetic algorithms*.

- ♣ Inspired by natural selection in biology.

1. Start with a population of k randomly generated states (individuals).
2. Select the *most fit* individuals to become parents of the next generation
3. Combine every ρ parents to form an offspring (typically $\rho = 2$).

Crossover: Split each of the parent strings and recombine the parts to form two children.

Mutation: Randomly change the bits of an offspring.

III. Evolutionary Algorithms

- ♣ Also called *genetic algorithms*.

- ♣ Inspired by natural selection in biology.

1. Start with a population of k randomly generated states (individuals).
2. Select the *most fit* individuals to become parents of the next generation
3. Combine every ρ parents to form an offspring (typically $\rho = 2$).

Crossover: Split each of the parent strings and recombine the parts to form two children.

Mutation: Randomly change the bits of an offspring.

Culling: All individuals below a threshold are discarded from the population.

III. Evolutionary Algorithms

- ♣ Also called *genetic algorithms*.

- ♣ Inspired by natural selection in biology.

1. Start with a population of k randomly generated states (individuals).
2. Select the *most fit* individuals to become parents of the next generation
3. Combine every ρ parents to form an offspring (typically $\rho = 2$).

Crossover: Split each of the parent strings and recombine the parts to form two children.

Mutation: Randomly change the bits of an offspring.

Culling: All individuals below a threshold are discarded from the population.

4. Go back to step 2 and repeat until *sufficiently fit* states are discovered (in which case the best one is chosen as a solution).

Genetic Algorithm (Pseudocode)

function GENETIC-ALGORITHM(*population*, *fitness*) **returns** an individual
repeat
 weights \leftarrow WEIGHTED-BY(*population*, *fitness*)
 population2 \leftarrow empty list
 for *i* = 1 **to** SIZE(*population*) **do**
 parent1, *parent2* \leftarrow WEIGHTED-RANDOM-CHOICES(*population*, *weights*, 2)
 child \leftarrow REPRODUCE(*parent1*, *parent2*)
 if (small random probability) **then** *child* \leftarrow MUTATE(*child*)
 add *child* to *population2*
 population \leftarrow *population2*
until some individual is fit enough, or enough time has elapsed
return the best individual in *population*, according to *fitness*

function REPRODUCE(*parent1*, *parent2*) **returns** an individual
 n \leftarrow LENGTH(*parent1*)
 c \leftarrow random number from 1 to *n*
 return APPEND(SUBSTRING(*parent1*, 1, *c*), SUBSTRING(*parent2*, *c* + 1, *n*))

Applications of GA

- ◆ Complex structured problems

Circuit layout, job-shop scheduling

- ◆ Evolving the architecture of deep neural networks

- ◆ Finding bugs of hardware

- ◆ Molecular structure optimization

- ◆ Image processing.

- ◆ Learning robots, etc.
